

SED1670

Dot Matrix High Duty LCD Driver

- 100 Output
- 1/64 to 1/300 in display duty
- CMOS High Voltage Resistant Process

■ OVERVIEW

The SED1670 is a 100 output low-power resistance common (row) driver which is suitable for driving a very high capacity dotmatrix LCD panels upto a duty ratio of 1/300. It is intended to be used in conjunction with the SED1640D or SED1606D as a pair.

Since the SED1670 is so designed to drive LCDs over a wide range of voltages, and also the maximum potential V_0 of its LCD drive bias voltages is isolated from V_{DD} to allow the LCD driving bias voltages to be externally generated optionally with a high accuracy, it can cope with a wide range of LCD panels.

Owing to its pad layout which can minimize its PC boards mounting space in addition to its selectable bidirectional driver output sequence and as many as 100 LCD output segments of high pressure resistance and low output impedance, it is possible to obtain the highest driver working efficiency for the 1/200 duty panel.

And the SED1670 can display 65 x 132 panel when used as a common driver of RAM built-in driver, SED1531.

■ FEATURES

- Number of LCD drive output segments: 100
- Common output ON resistance: 700Ω (Typ.)
- Display duty ratio: 1/64 to 1/300 (Reference)
- Display capacity: Possible to display 640 x 480 dots when used in combination with SED 1640D or SED1606D.
- Selectable pin output shift direction
- No-bias display OFF function (*1*)
- Instantaneous display blanking enabled by inhibit function (*0*)
- Adjustable offset bias of LCD power to V_{DD} level
- Wide range of LCD drive voltages: -7 V to -28 V (Absolute maximum rated voltage: -30 V)
- Logic system power supply: -2.7 V to -5.5 V
- Chip packaging
 - SED1670D0A (Al-pad die form)
 - SED1670D1A
 - SED1670D0B (Au bump die form)
 - SED1670D1B
 - SED1670T0A (TCP die form) * Under Planning
 - SED1670T1A * Under Planning
- No radial rays countermeasure taken in designing

- Notes:
1. The voltage of V₀, V₁ and V₄ must always satisfy the condition of $V_{DD} \geq V_0 \geq V_1 \geq V_4 \geq V_5$.
 2. Floating of the logic system power during while the LCD drive system power is applied, or exceeding $V_{SS} = -2.6$ V or more can cause permanent damage to the LSI. Functional operation under these conditions is not implied.
Care should be taken to the power supply sequence especially in the system power ON or OFF.
